REVIEW OF THE 1943 CROP SEASON

(FINAL ESTIMATES)

Colorado crop and livestock production during 1943, which marked the second war year, set a new high record even exceeding the large 1942 volume. New high production records were set for six important crops—wheat, dry beans, barley, peaches, onions and broomcorn. The potato crop was the second largest harvested in the State. The number of chickens, eggs and hogs marketed was much above the number marketed during any previous year. Milk production was maintained at a high level. Cattle marketings were liberal, yet the cattle inventory continued large.

The acreage of all crops planted or grown in 1943 totalled 6,854,000 acres, an increase of 3.5 per cent from the 1942 total. Although the season had some unfavorable weather aspects, on the whole it may be characterized as favorable. Abandonment of planted acreage was less than usual and 6,206,000 acres of crops were harvested, an area 5 per cent larger than in 1942. The bountiful production in 1943 was partially the result of favorable weather conditions, but also resulted from long hours of toil on the part of farm and ranch operators, who accomplished this record volume of production under considerable handicap in the way of shortage of labor, some items of farm equipment and some transportation difficulties. Colorado agriculture made an outstanding contribution to the nation's unprecedented war food needs. Costs of production were considerably higher in 1943 than in 1942 and years preceding. Wages paid to hired farm labor were at record levels. Gross income from marketings of crops, livestock and livestock products during 1943 totalled \$304,452,000 in comparison with \$236,000,000 in 1942 and \$201,000,000 in 1929. Although the 1943 income was at a record high, costs of production were also very high, thus restricting net income.

Potatoes—The estimate of production was 18,531,000 bushels, which compares with 17,020,000 bushels harvested in 1942 and 13,213,000 the 10-year (1932-41) average. Only in the year 1922, when 19,040,000 bushels were harvested, did production exceed that of 1943. Quality of the 1943 crop was unusually good and rate of movement to market was unusually rapid. The large production in 1943 was due to the large increase in planted acreage and above average yield per acre. The crop was valued at \$23,905,000 compared with \$19,573,000 for the 1942 crop.

Sugar Beets—The crop was very promising until late August, when dry weather, which continued through digging in October and November, curtailed development. Beets were badly dehydrated in the ground and the dry fleld condition made harvest difficult. What promised to be a fairly satisfactory tonnage totalled only 1,623,000 tons compared with the large 1942 crop of 2,178,000 tons and the 10-year average of 1,961,000 tons. The small 1943 crop was the result of sharp curtailment of plantings from 195,000 acres to 139,000 acres, of which 133,000 acres were harvested. Yield per acre at 12.2 tons was below average.

Beans—With a record dry bean crop of 2,865,000 one-hundred-pound bags, Colorado ranked as one of the large bean producing states in the country in 1943, being surpassed only by California and Michigan. Acreage planted was the largest of record, but yields on a good many eastern dry land fields were disappointing. Abandonment totalled 88,000 acres and only 507,000 acres were

harvested, which compared with 307,000 acres harvested in 1942. Yields were fair to good in irrigated sections and the highest of record in the southwestern dry land section where production exceeded one-half million bags. Production in 1942 was 1,903,000 bags and the 10-year average 1,257,000 bags. The 1943 crop was valued at \$15,185,000 against \$8,319,000 for the 1942 crop.

Wheat—Production was estimated at 31,616,000 bushels of both spring and winter wheat. This estimate exceeded the previous record of 27,406,000 bushels harvested in 1942 and was nearly three times the 10-year average of 12,061,000 bushels. Winter wheat production in 1943 at 29,381,000 bushels was much the largest of record, part of which resulted from harvesting 200,000 acres of "volunteer" wheat. The average yield per acre of winter wheat harvested from "planted" dry land was almost phenomenal at 25 bushels per acre. The 1943 crop of all wheat was valued at \$40,785,000 against \$28,502,000 for the 1942 crop.

Rye and Dry Peas—Rye production in 1943 was again at a high level with a crop of 1,332,000 bushels against 1,375,000 bushels harvested in 1942, and was nearly four times as large as the 10-year average. The rye acreage has been large in recent years due to restrictions on wheat planting. Production of dry peas totalled 272,000 100-pound bags against 270,000 bags in 1942 and 129,000 bags the 10-year average.

Corn—Early prospects were excellent, but mid-summer dry weather curtailed production in eastern dry land area. Irrigated yields were exceptionally high, reflecting the influence of the more general use of hybrid seed. Production of corn for all purposes in 1943 totalled 15,063,000 bushels compared with 18,228,000 bushels harvested in 1942 and 11,199,000 bushels the 10-year average. In 1943, 10,096,000 bushels were harvested "for grain" compared with 13,786,000 bushels so harvested in 1942. Most corn was of good quality. Of the total 1943 crop, over 7,000,000 bushels were harvested from irrigated land. The 1943 crop of all corn was valued at \$17,172,000 compared with \$16,223,000 for the 1942 crop.

Oats and Barley—A record barley crop of 17,616,000 bushels was harvested, which compared with 15,816,000 bushels in 1942 and was nearly double the 10-year average of 8,859,000 bushels. Winter barley contributed largely to the production in both 1942 and 1943. Oats production in 1943 was not outstanding, but was well above average with yields quite satisfactory. The crop totalled 5,828,000 bushels against 5,647,000 bushels in 1942 and 4,253,000 bushels the 10-year average. The combined value of oats and barley in 1943 was \$20,755,000 compared with \$12,675,000 in 1942.

Sorghums—The quantity of all sorghums harvested "for grain" totalled 1,823,000 bushels compared with 1,744,000 bushels in 1942 and 1,007,000 bushels the 10-year average. Production of all sorghum forage totalled 396,000 tons against 542,000 tons in 1942 and 363,000 tons for the 10-year average.

Hay Crops—Production of all tame hay was placed at 1,801,000 tons against 1,856,000 tons in 1942 and 1,648,000 tons the 10-year average. The alfalfa crop which is included with all tame hay, was estimated at 1,327,000 tons in 1943, against 1,369,000 tons in 1942. Wild hay production totalled 380,000 tons in 1943, 420,000 tons in 1942 and 332,000 tons the 10-year average. The inventory of hay-consuming animals was relatively large. Hay prices were double those of 1942 and in some areas supplies or hay and rough feed were quite limited in relation to feeding demands. Large quantities of alfalfa hay were sold to mills and dehydrators in 1943, especially in the Arkansas Valley.

Broomcorn—The 1943 broomcorn crop of 13,900 tons was the largest ever harvested in Colorado and amounted to about two-fifths of the nation's total of 32,500 tons. The 1942 Colorado crop was 10,200 tons and the 10-year average 4,590 tons. Value of the 1943 crop was \$3,475,000 and for the 1942 crop was \$1,826,000.

Fruit Crops—The year 1943, like 1942, was not on the whole a favorable one for fruit crops. However, peach production was at a record level with a crop of 1,978,000 bushels which compared with 1,490,000 bushels in 1942 and 1,382,000 bushels the 10-year average. The commercial apple crop was 1,140,000 bushels against 1,595,000 bushels in 1942 and 1,600,000 bushels the 8-year (1934-41) average. Other fruit crops 1943, 1942 and 10-year average were as follows: Pears 264,000; 177,000; and 199,000 bushels. Grapes 400; 500; and 515 tons. All cherries 4,110; 3,050; and 3,415 tons. The sweet cherry crop was particularly large in 1943.

REVIEW OF THE 1944 CROP SEASON

(PRELIMINARY ESTIMATES)

The agricultural production from Colorado farms and ranches during 1944, which marked the third war year, was above average, but the aggregate was moderately lower than during each of the two preceding war years. crops established new high production records. These were sorghums "for grain", peaches and broomcorn. The combined production of eight grain crops (wheat, corn, oats, beans, barley, etc.) totalled 64,671,000 bushels. This quantity was above the 10-year (1933-42) average of 43,768,000 bushels by nearly 50 per cent, but was below the 78-million-bushel production of these grains in 1943. The crops of hay and roughage were large, both in comparison with 1943 and with the 10-year average. The crops of potatoes and beans were unusually large. The year 1944 was a favorable one for fruit in all parts of the State. Sugar beet tonnage was low, as acreage harvested was the smallest in more than 20 years; but this was partly made up by unusually high sugar content. The supply of irrigation water was generally adequate. The acreage of all principal crops planted or grown in 1944 totalled 6,774,000 acres, a decrease of 1.2 per cent from the 1943 total. The acreage of crop failure was larger in 1944 than in 1943 and the harvested acreage of 5,860,000 acres was 3.0 per cent smaller than the 1943 total. Prices continued high and preliminary indications are that receipts from marketings of crops, livestock and livestock products may total \$320,000,000 for a new high record.

Although the year 1944 was favorable in many respects, there were also numerous severe handicaps. Spring work was delayed by frequent rains and cold weather retarded the early development of crops. Winter wheat in the Eastern Plains section was unusually late and yields were sharply curtailed in East Central and Northern counties by the worst epidemic of rust since 1923. Rust also damaged spring-planted small grains. The abandonment of sugar beet acreage was unusual due to poor stands, weed growth, and, in some cases, shortage of labor. The western two-thirds of the State suffered from summer drought, but, on the whole, the grazing season was good as an unusually good crop of grass was "made" by early moisture. Potato yields were low in the Northwest and Mountain Sections as a result of insufficient moisture and early frost. Early frost also curtailed potato yields in parts of the San Luis Valley. Marketings of all classes of livestock were very liberal throughout the year and cattle and lambs came off grass in very good flesh. Farm wages ruled at record high levels throughout the year. Farm operators worked long hours and the job of agricultural production was made more difficult by labor shortage and other handicaps. Even so, only relatively small quantities of production wasted.

Potatoes—The 1944 crop totalled 18,779,000 bushels compared with 18,531,000 bushels harvested in 1943 and 13,650,000 bushels the 10-year (1933-42) average. The 1944 crop was the second largest ever raised in Colorado. Quality was good, especially in the Northern Colorado section. Rate of movement to market was exceptionally rapid. The large 1944 crop was due primarily to a larger acreage being harvested, but resulted also from high yield per acre which averaged 211 bushels. The 1944 crop was valued at \$25,352,000 against \$23,905,000 for the 1943 crop.

Sugar Beets—The crop was off to a late start and 20,000 of the 136,000 acres planted were abandoned and the acreage harvested was the smallest since 1911. The summer growing season was generally favorable with a good supply of irrigation water. A late fall with a large amount of sunshine resulted in sugar content being exceptionally high. Although only 1,427,000 tons of beets were harvested in 1944 compared with 1,623,000 tons in 1943, the amount of sugar made from these beets was little different in the two years. Average production of sugar beets in Colorado during the 10 years (1933-42) was 2,001,000 tons. For many farmers, sugar beets were the best paying crop in 1944.

Beans—The production of dry, edible beans was unusually large again in 1944, but was considerably below the record crop harvested in 1943. The comparison being 2,088,000 bags and 2,865,000 bags. Average production is 1,406,000 bags. Irrigated yields were good in most areas with dry land yields generally rather low. The crop in Southwestern Colorado was less than half as large as 1944's record production which resulted from unusually high yields per acre. The 1944 crop was valued at \$11,582,000 against \$15,188,000 for the 1943 crop.

Wheat—Production was estimated at 19,137,000 bushels compared with the record 1943 crop of 31,616,000 bushels and the 10-year average of 14,084,000 bushels. Winter wheat developed much later than usual in Eastern Colorado and spring and early summer moisture was above average. This combination of circumstances permitted the development of a black stem rust epidemic, the worst since 1923, which levied heavy toll on wheat yields in East Central and Northern Colorado. Wheat in the southeastern part of the State was sufficiently advanced to escape rust injury and yields were good. Spring wheat yields were also reduced by rust infestation. Nearly 400,000 of the 1,608,000 acres of wheat planted were abandoned due to drought, hail, rust, etc. Yield per acre harvested was 15.8 bushels per acre for winter wheat and 15.0 bushels for spring wheat. The 1944 wheat crop was valued at \$26,026,000 against \$40,785,000 for the 1943 crop.

Corn—Although corn was planted late and development was slow early in the season, summer growing weather was generally favorable and this, together with an especially late fall, permitted development of a corn crop moderately larger than the crop of 1943 and above average. Yields were exceptionally good in irrigated areas and in dry land sections of counties bordering on Kansas and Nebraska. Quality was generally good, but harvest progressed slowly. The 1944 crop of corn for all purposes totalled 16,283,000 bushels. The 1943 crop totalled 15,063,000 bushels and the 10-year average 11,721,000 bushels. Corn harvested "for grain" totalled 11,414,000 bushels against 10,086,000 bushels in 1943. Value of the entire 1944 corn crop was \$18,725,000 against \$17,172,000 for the 1943 crop.

Oats and Barley—Barley production continued at a high level with a crop of 14,986,000 bushels. The record 1943 crop totalled 17,616,000 bushels and the 10-year average 9,620,000 bushels. Production of oats was estimated at 5,452,000 bushels, which compared with 5,828,000 bushels in 1943 and 4,373,000 bushels

the 10-year average. Yields of both these crops were adversely affected by rust in Eastern Colorado. Value of the 1944 crop of oats and barley was \$17,699,000. The 1943 crop was valued at \$20,755,000.

Sorghums—The quantity of all sorghums harvested "for grain" was 4,746,000 bushels and was much the largest crop of such grain ever harvested in the State. In 1943, production of sorghums "for grain" was 1,823,000 bushels and the 10-year average 1,160,000 bushels. Production of sorghum forage was also large, being 420,000 tons against 396,000 tons in 1943 and 390,000 tons the 10-year average. A large percentage of these sorghums were produced in counties bordering on Kansas.

Hay Crops—With a large cattle inventory, the above-average hay crops of 1944 were much needed. Production of tame hay totalled 1,910,000 tons, which exceeded 1943 production by over 100,000 tons. Average production during the 10 years (1933-42) was 1,651,000 tons. Wild hay production totalled 388,000 tons against 380,000 tons in 1943 and 344,000 tons the 10-year average. Hay prices were moderately lower than in 1943, but were nearly double those prevailing in 1942. As in 1943, large quantities of alfalfa hay were sold to dehydrators, especially from the Arkansas Valley. Much stacked hay was ground in the field and shipped from the State.

Broomcorn—The 1944 broomcorn crop of 17,700 tons was much the largest ever harvested in Colorado and was more than 25 per cent of the nation's total. The 1943 crop, the previous record of production, was 13,900 tons and the 5-year average only 5,050 tons. Prices received for the 1944 crop were expected to average \$200 per ton and value of the crop in each of the two years 1943 and 1944 was approximately \$3,500,000. Most of Colorado's broomcorn is grown in Baca County.

Fruit Crops—The year 1944 was the first generally favorable year for fruit since 1940. Crops of all fruits in all parts of the State were generally large with peach production setting a new high record of 2,112,000 bushels, which compared with 1,978,000 bushels in 1943 and 1,411,000 the 10-year average. The commercial apple crop of 2,002,000 bushels was the largest since 1936. Production in 1943 was 1,140,000 bushels and the 10-year average 1,600,000 bushels. Cherries were also in large supply with a crop of 5,340 tons, of which 500 tons were sweet cherries. The 1943 crop totalled 4,110 tons of which 400 tons were sweet cherries. Ten-year average production of all cherries was 3,338 tons. The 1944 grape crop amounted to 600 tons, which was much above the 1943 crop and above average. Pears were in short supply due to unfavorable conditions in parts of Mesa County. The crop totalled 157,000 bushels and was only three-fifths as large as the 1943 crop and was below average.

| | | | | | | | | |

¹Includes rental and benefit, soil conservation, agricultural adjustment program, price parity and Sugar Act payments.

²Total of columns 3 and 4.

³Includes value of products consumed by farm laborers and their families as well as in the operator's own household.

^{*}Estimated.

LIVESTOCK INVENTORY AND VALUE (JANUARY 1, 1945, PRELIMINARY AND 1944 REVISED)

The number of each species of livestock on Colorado farms and ranches was smaller on January 1, 1945 than on January 1, 1944. The total value of each species, except sheep, was also smaller. Value per head was lower for cattle, horses and mules. The aggregate value of all species combined totalled \$162,109,000 on January 1, 1945, compared with \$176,597,000 January 1, 1944. The decline in number of all cattle and calves during 1944 was 2 per cent, milk cows 2 per cent, hogs 54 per cent, stock sheep 8 per cent, horses 5 per cent, mules 11 per cent, chickens 23 per cent and turkeys 25 per cent. The number of lambs in feed lots was 2 per cent larger on January 1, 1945, than on January 1, 1944. Even with the decline which occurred during 1944, the number of cattle and calves on farms and ranches January 1, 1945, was still the second largest of record. Hog numbers were the smallest since 1941 and the number of stock sheep the smallest since 1929. The decline in number of horses was a continuation of the decrease which has continued for a quarter of a century, and numbers January 1, 1945, were the smallest since 1890. The number of mules was the smallest since 1902. The smaller hog inventory will be reflected in a sharp decrease in hog marketings during the first 9 months of 1945. The decrease in chickens will be in evidence in lower egg production during the first 9 months of 1945 in comparison with these months in 1944, while the smaller stock sheep inventory will be further recorded in a reduction of the 1945 wool clip. With the exception of 1934, when many Colorado animals were forced on the market by extreme drought conditions, the year 1944 was probably the only other year in the State's history when each species of livestock showed a decrease in numbers during the period of one year. The decline between January 1, 1944, and January 1, 1945, was largely the result of the limited supply of feed grains and relatively high feed prices in relation to livestock prices.

All Cattle and Calves—After reaching a record of 1,920,000 head at the beginning of 1944, heavy marketings and smaller inshipments during 1944 resulted in a decline of the cattle inventory to 1,882,000 head, as of January 1, 1945. The sharp expansion in cattle numbers in Colorado in recent years has been in the area east of the mountains where revegetation of native grasses has furnished excellent pasture feed. Numbers have been held in check in the mountain and western areas by natural limitations and Forest and Grazing Service restrictions. The January 1, 1945, inventory consisted of an unusually large percentage of cows and heifers one to two years old and a smaller proportion of calves and steers. The cattle and calf inventory was valued at \$115,349,000 January 1, 1945, compared with \$121,798,000 January 1, 1944. Value per head was \$61.30 against \$63.40.

Milk Cows—The milk cow inventory continued at a low level with 246,000 head January 1, 1945, compared with 251,000 head January 1, 1944. There was no wholesale liquidation of dairy herds during 1944, but the re-allocation of herds which had been in evidence for several years continued in 1944. Fewer replacements were held. The dairy industry has been adversely affected by labor shortage, difficulty of getting some kinds of equipment and high feed prices. The January 1, 1945, milk cow inventory was valued at \$22,632,000 compared with \$23,845,000 January 1, 1944. Value per head was \$92.00 against \$95.00 January 1, 1944.

Sheep and Lambs—Ewes and ewe lambs were sold very close during 1944 and the stock sheep inventory January 1, 1945, numbered only 1,635,000 head. This was a decrease of 8 per cent compared with the 1,777,000 head on Colorado farms and ranches January 1, 1944. The 8 per cent decline in numbers during 1944 was even greater than the decrease under forced sale conditions which

resulted from the effects of the 1943 drought. The January, 1945, inventory consisted of an unusually large percentage of young ewes as old ewes were sold very close. Labor costs and other expenses of the sheep industry increased rapidly during the war years without commensurate increase in the price of wool and lambs. Reports indicated that losses have increased due to shortage of experienced labor and losses from coyotes seem to be increasing. The number of lambs in feed lots January 1, 1945, totalled 840,000 head compared with 825,000 head a year earlier. The entire sheep inventory was valued at \$26,770,000 January 1, 1945, compared with \$25,712,000 as of January 1, 1944. Value per head was \$10.80 against \$9.90 January 1, 1944.

Hogs—Hog numbers declined 54 per cent during 1944 from the record total of 774,000 head at the beginning of that year. The January 1, 1944, number totalled only 356,000 head. This decrease in inventory resulted from the very sharp reduction in the pig crops of 1944 compared with the large pig crops of 1943. The decline of 54 per cent in inventory is the largest ever recorded in one year and was the result of unprofitable operations experienced during the early months of 1944. The January 1, 1945, hog inventory was valued at \$6,457,000 compared with \$10,187,000 January 1, 1944. Value per head January 1, 1945, was \$18.10 compared with \$13.20 January 1, 1944.

Horses and Mules—The number of both species continued to decline during 1944. Horse numbers January 1, 1945, totalled only 192,000 head compared with 202,000 head January 1, 1944. In January, 1919, the horses on Colorado farms and ranches totalled 440,000 head. Mule numbers January 1, 1945, and January 1, 1944, were 8,000 and 9,000 head respectively. Value per head of both species was lower, horses being \$42 against \$59, and mules \$75 against \$81.

Poultry—Fewer chickens were raised during 1944 than during 1943 and this decrease carried through to a smaller January 1, 1945, inventory totalling only 4,004,000 birds compared with 5,254,000 birds January 1, 1944. Value per bird was unchanged at \$1.04. The total value of chickens was \$4,164,000 January 1, 1945, compared with \$5,464,000 a year earlier. According to plans reported in early February, 1945, Colorado farmers and poultrymen expected to raise 10 per cent fewer chickens in 1945 than were raised in 1944. Turkeys totalled only 129,000 head January 1, 1945, compared with 172,000 head January 1, 1944. The 1945 inventory was valued at \$658,000 against \$860,000 for the January 1, 1944, flocks.

Lamb Crop—The 1944 lamb crop of 1,185,000 head was the smallest since 1935. This small crop resulted partly from a reduction in the number of ewes of breeding age in the inventory at the beginning of the year, but the crop was small primarily because of heavy death losses experienced during the unfavorable spring weather. The greatest shortage in the lamb crop was in the Eastern Colorado section. The 1944 lamb crop was 14 per cent smaller than the 1,375,000 head saved in 1943 and was 6 per cent smaller than the 10-year average of 1,257,000 head.

Pig Crops—After reaching an all-time record in 1943 with 961,000 pigs saved, hog production declined sharply. The combined spring and fall pig crops of 1944, estimated at 439,000 pigs saved, was less than half as large as the 1944 total and was fully one-third smaller than the number of pigs saved in 1942. Reports of farmers received early in December, 1944, revealed that further reduction in hog raising was planned for the spring of 1945. Hog raisers reported that they expected to breed 20 per cent fewer sows to farrow the spring pig crop of 1945 than farrowed the spring pig crop of 1944.

Wool—Wool shorn from the backs of Colorado sheep during 1944 was estimated at 13,259,000 pounds. The clip was valued at \$5,436,000. In 1943, 15,458,000 pounds of wool were shorn and the clip was worth \$6,029,000. Fleece weight averaged 8.2 pounds in 1944 and 8.6 pounds in 1943. Only 1,617,000 sheep were shorn in 1944 compared with 1,805,000 head shorn in 1943.
